**Pharmacotherapy for Smoking Cessation**  
(a one-hour continuing education program)

This program provides an overview of all FDA-approved medications for cessation (nicotine patch, lozenge, gum, inhaler, nasal spray and bupropion SR and varenicline). All behavioral counseling information is provided through handouts.

**Goal**

To provide clinicians with the knowledge and skills necessary to assist patients in the proper selection and use of pharmacotherapy for smoking cessation.

**Learning Objectives**

Upon completion of this Rx for Change continuing education program, participants will be able to:

1. List five health risks associated with chronic tobacco use.
2. Describe dosing and use of the following first-line pharmacologic agents:
   - Nicotine polacrilex gum
   - Nicotine polacrilex lozenge
   - Nicotine transdermal patch
   - Nicotine nasal spray
   - Nicotine inhaler
   - Bupropion SR
   - Varenicline
3. Compare the efficacy of the various pharmacologic aids for cessation.
4. Describe the relative daily costs of pharmacotherapy compared to cigarette smoking.
ASSISTING PATIENTS with TOBACCO CESSATION:
A Behavioral Approach

“CIGARETTE SMOKING... is the chief, single, avoidable cause of death in our society and the most important public health issue of our time.”

C. Everett Koop, M.D., former U.S. Surgeon General

All forms of tobacco are harmful.

70% want to quit

Graph provided by the Centers for Disease Control and Prevention. 1955 Current Population Survey; 1965–2005 NHIS. Estimates since 1992 include some-day smoking.

ANNUAL U.S. DEATHS ATTRIBUTABLE to SMOKING, 2000–2004 Percent of all smoking-attributable deaths

Cardiovascular diseases 128,497 29%
Lung cancer 125,522 28%
Respiratory diseases 103,338 23%
Second-hand smoke 49,400 11%
Cancers other than lung 35,326 8%
Other 1,512 <1%

TOTAL: 443,595 deaths annually

ANNUAL SMOKING-ATTRIBUTABLE ECONOMIC COSTS

Health-care expenditures
Lost productivity costs
Total federal-state Medicaid program costs
Total Medicare program costs
Total economic burden of smoking, per year

Societal costs: $10.28 per pack of cigarettes smoked

**TOBACCO DEPENDENCE:**

**Physiological**
- The addiction to nicotine
- Treatment: Medications for cessation

**Behavioral**
- The habit of using tobacco
- Treatment: Behavior change program

Treatment should address the physiological and the behavioral aspects of dependence.

**CLINICAL PRACTICE GUIDELINE for TREATING TOBACCO USE and DEPENDENCE**

- Update released May 2008
- Sponsored by the U.S. Department of Health and Human Services, Public Health Service with:
  - Agency for Healthcare Research and Quality
  - National Heart, Lung, & Blood Institute
  - National Institute on Drug Abuse
  - Centers for Disease Control and Prevention
  - National Cancer Institute

www.surgeongeneral.gov/tobacco/

**EFFECTS of CLINICIAN INTERVENTIONS**

With help from a clinician, the odds of quitting approximately doubles.

- Compared to patients who receive no assistance from a clinician, patients who receive assistance are 1.7–2.2 times as likely to quit successfully for 5 or more months.

![Graph showing effects of clinician interventions](image)

**The 5 A’s**

- **ASK**
  - “Do you ever smoke or use any type of tobacco?”
  - “I take time to ask all of my patients about tobacco use—because it’s important.”
  - “Condition X often is caused or worsened by smoking. Do you, or does someone in your household smoke?”
  - “Medication X often is used for conditions linked with or caused by smoking. Do you, or does someone in your household smoke?”

- **ADVISE**
- **ASSESS**
- **ASSIST**
- **ARRANGE**
The 5 A’s (cont’d)

- **ADVISE** tobacco users to quit (clear, strong, personalized)
  - “It’s important that you quit as soon as possible, and I can help you.”
  - “Cutting down while you are ill is not enough.”
  - “Occasional or light smoking is still harmful.”
  - “I realize that quitting is difficult. It is the most important thing you can do to protect your health now and in the future. I have training to help my patients quit, and when you are ready, I will work with you to design a specialized treatment plan.”

- **ASSESS** readiness to make a quit attempt
  - **ASSIST** with the quit attempt
    - Not ready to quit: provide motivation (the 5 R’s)
    - Ready to quit: design a treatment plan
    - Recently quit: relapse prevention

The 5 A’s (cont’d)

- **ARRANGE** follow-up care

</table>

* 5 months (or more) postcessation

Provide assistance throughout the quit attempt.

**METHODS for QUITTING**

- Nonpharmacologic
  - Counseling and other non-drug approaches

- Pharmacologic
  - FDA-approved medications

Counseling and medications are both effective, but the combination of counseling and medication is more effective than either alone.

**PHARMACOLOGIC METHODS: FIRST-LINE THERAPIES**

Three general classes of FDA-approved drugs for smoking cessation:

- Nicotine replacement therapy (NRT)
  - Nicotine gum, patch, lozenge, nasal spray, inhaler

- Psychotropics
  - Sustained-release bupropion

- Partial nicotinic receptor agonist
  - Varenicline

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
PHARMACOTHERAPY

“Clinicians should encourage all patients attempting to quit to use effective medications for tobacco dependence treatment, except where contraindicated or for specific populations* for which there is insufficient evidence of effectiveness.”

* Includes pregnant women, smokeless tobacco users, light smokers, and adolescents.

Medications significantly improve success rates.

PHARMACOTHERAPY: USE in PREGNANCY

- The Clinical Practice Guideline makes no recommendation regarding use of medications in pregnant smokers
- Insufficient evidence of effectiveness
- Category C: varenicline, bupropion SR
- Category D: prescription formulations of NRT

“Because of the serious risks of smoking to the pregnant smoker and the fetus, whenever possible pregnant smokers should be offered person-to-person psychosocial interventions that exceed minimal advice to quit.” (p. 166)

PHARMACOTHERAPY: OTHER SPECIAL POPULATIONS

Pharmacotherapy is not recommended for:
- Smokeless tobacco users
  - No FDA indication for smokeless tobacco cessation
- Individuals smoking fewer than 10 cigarettes per day
- Adolescents
  - Nonprescription sales (patch, gum, lozenge) are restricted to adults ≥18 years of age
  - NRT use in minors requires a prescription

Recommended treatment is behavioral counseling.

NRT: RATIONALE for USE

- Reduces physical withdrawal from nicotine
- Eliminates the immediate, reinforcing effects of nicotine that is rapidly absorbed via tobacco smoke
- Allows patient to focus on behavioral and psychological aspects of tobacco cessation

NRT products approximately doubles quit rates.

NRT: PRODUCTS

- Polacrilex gum
  - Nicorette (OTC)
  - Generic nicotine gum (OTC)
- Lozenge
  - Nicorette Lozenge (OTC)
  - Nicorette Mini Lozenge (OTC)
  - Generic nicotine lozenge (OTC)
- Nasal spray
  - Nicotrol NS (Rx)
- Inhaler
  - Nicotrol (Rx)

Patients should stop using all forms of tobacco upon initiation of the NRT regimen.

PLASMA NICOTINE CONCENTRATIONS for NICOTINE-CONTAINING PRODUCTS

Patients should stop using all forms of tobacco upon initiation of the NRT regimen.

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
NRT: PRECAUTIONS

- Patients with underlying cardiovascular disease
  - Recent myocardial infarction (within past 2 weeks)
  - Serious arrhythmias
  - Serious or worsening angina

NRT products may be appropriate for these patients if they are under medical supervision.

NICOTINE GUM
Nicorette (GlaxoSmithKline); generics

- Resin complex
  - Nicotine
  - Polacrilin
- Sugar-free chewing gum base
- Contains buffering agents to enhance buccal absorption of nicotine
- Available: 2 mg, 4 mg; original, cinnamon, fruit, mint (various), and orange flavors

NICOTINE GUM: SUMMARY

ADVANTAGES
- Might satisfy oral cravings.
- Might delay weight gain (4-mg strength).
- Patients can titrate therapy to manage withdrawal symptoms.
- A variety of flavors are available.

DI SADVANTAGES
- Need for frequent dosing can compromise compliance.
- Might be problematic for patients with significant dental work.
- Patients must use proper chewing technique to minimize adverse effects.
- Gum chewing might not be socially acceptable.

NICOTINE LOZENGE
Nicorette Lozenge and Nicorette Mini Lozenge (GlaxoSmithKline); generics

- Nicotine polacrilex formulation
  - Delivers ~25% more nicotine than equivalent gum dose
- Sugar-free mint, cherry flavors
- Contains buffering agents to enhance buccal absorption of nicotine
- Available: 2 mg, 4 mg

TRANSDERMAL NICOTINE PATCH
NicoDerm CQ (GlaxoSmithKline); generic

- Nicotine is well absorbed across the skin
- Delivery to systemic circulation avoids hepatic first-pass metabolism
- Plasma nicotine levels are lower and fluctuate less than with smoking

NICOTINE NASAL SPRAY
Nicotrol NS (Pfizer)

- Aqueous solution of nicotine in a 10-ml spray bottle
- Each metered dose actuation delivers
  - 50 mcL spray
  - 0.5 mg nicotine
- ~100 doses/bottle
- Rapid absorption across nasal mucosa

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
**NICOTINE NASAL SPRAY:**
**SUMMARY**

**ADVANTAGES**
- Patients can easily titrate therapy to rapidly manage withdrawal symptoms.

**DISADVANTAGES**
- Need for frequent dosing can compromise compliance.
- Nasal/throat irritation may be bothersome.
- Higher dependence potential.
- Patients with chronic nasal disorders or severe reactive airway disease should not use the spray.

**NICOTINE INHALER**
Nicotrol Inhaler (Pfizer)

- Nicotine inhalation system consists of:
  - Mouthpiece
  - Cartridge with porous plug containing 10 mg nicotine and 1 mg menthol
- Delivers 4 mg nicotine vapor, absorbed across buccal mucosa

**NICOTINE INHALER: SUMMARY**

**ADVANTAGES**
- Patients can easily titrate therapy to rapidly manage withdrawal symptoms.
- The inhaler mimics the hand-to-mouth ritual of smoking.

**DISADVANTAGES**
- Need for frequent dosing can compromise compliance.
- Initial throat or mouth irritation can be bothersome.
- Cartridges should not be stored in very warm conditions or used in very cold conditions.
- Patients with underlying bronchospastic disease must use the inhaler with caution.

**BUPROPION SR**
Zyban (GlaxoSmithKline); generic

- Nonnicotine cessation aid
- Sustained-release antidepressant
- Oral formulation

**BUPROPION:**
**MECHANISM of ACTION**

- Atypical antidepressant thought to affect levels of various brain neurotransmitters
  - Dopamine
  - Norepinephrine
- Clinical effects
  - ↓ craving for cigarettes
  - ↓ symptoms of nicotine withdrawal

**BUPROPION:**
**CONTRAINDICATIONS**

- Patients with a seizure disorder
- Patients taking
  - Wellbutrin, Wellbutrin SR, Wellbutrin XL
  - MAO inhibitors in preceding 14 days
- Patients with a current or prior diagnosis of anorexia or bulimia nervosa
- Patients undergoing abrupt discontinuation of alcohol or sedatives (including benzodiazepines)
### BUPROPION: WARNINGS and PRECAUTIONS

- Neuropsychiatric symptoms and suicide risk
  - Changes in mood (depression and mania)
  - Psychosis/hallucinations/paranoia/delusions
  - Homicidal ideation/hostility
  - Agitation/anxiety/panic
  - Suicidal ideation or attempts
  - Completed suicide

**Patients should stop bupropion and contact a health care provider immediately if agitation, hostility, depressed mood or changes in thinking or behavior (including suicidal ideation) are observed.**

### BUPROPION: WARNINGS and PRECAUTIONS (cont’d)

Bupropion should be used with caution in the following populations:
- Patients with a history of seizure
- Patients with a history of cranial trauma
- Patients taking medications that lower the seizure threshold (antipsychotics, antidepressants, theophylline, systemic steroids)
- Patients with severe hepatic cirrhosis
- Patients with depressive or psychiatric disorders

### BUPROPION SR: DOSING

**Patients should begin therapy 1 to 2 weeks PRIOR to their quit date to ensure that therapeutic plasma levels of the drug are achieved.**

**Initial treatment**
- 150 mg po q AM x 3 days

**Then...**
- 150 mg po bid
- Duration, 7–12 weeks

### BUPROPION: ADVERSE EFFECTS

**Common side effects include the following:**
- Insomnia (avoid bedtime dosing)
- Dry mouth

**Less common but reported effects:**
- Tremor
- Skin rash

### BUPROPION SR: SUMMARY

**ADVANTAGES**
- Easy to use oral formulation.
- Twice daily dosing might reduce compliance problems.
- Might delay weight gain
- Bupropion might be beneficial for patients with depression.

**DI SADVANTAGES**
- The seizure risk is increased.
- Several contraindications and precautions preclude use in some patients.

### VARENICLINE

Chantix (Pfizer)

- Nonnicotine cessation aid
- Partial nicotinic receptor agonist
- Oral formulation

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
VARENICLINE: MECHANISM of ACTION

- Binds with high affinity and selectivity at $\alpha_4\beta_2$ neuronal nicotinic acetylcholine receptors
- Stimulates low-level agonist activity
- Competitively inhibits binding of nicotine
- Clinical effects
  - ↓ symptoms of nicotine withdrawal
  - Blocks dopaminergic stimulation responsible for reinforcement & reward associated with smoking

VARENICLINE: WARNINGS and PRECAUTIONS

- Neuropsychiatric Symptoms and Suicidality
  - Changes in mood (depression and mania)
  - Psychosis/hallucinations/paranoia/delusions
  - Homicidal ideation/hostility
  - Agitation/anxiety/panic
  - Suicidal ideation or attempts
  - Completed suicide

Patients should stop varenicline and contact a health care provider immediately if agitation, hostility, depressed mood or changes in thinking or behavior (including suicidal ideation) are observed.

VARENICLINE: WARNINGS and PRECAUTIONS (cont’d)

- Cardiovascular adverse events in patients with existing cardiovascular disease
- Hypersensitivity reactions
- Serious skin reactions
- Accidental injury
- Nausea

VARENICLINE: DOSING

Patients should begin therapy 1 week PRIOR to their quit date. The dose is gradually increased to minimize treatment-related nausea and insomnia.

<table>
<thead>
<tr>
<th>Treatment Day</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day 1 to day 3</td>
<td>0.5 mg qd</td>
</tr>
<tr>
<td>Day 4 to day 7</td>
<td>0.5 mg bid</td>
</tr>
<tr>
<td>Day 8 to end of treatment*</td>
<td>1 mg bid</td>
</tr>
</tbody>
</table>

* Up to 12 weeks

VARENICLINE: ADVERSE EFFECTS

- Common (≥5% and 2-fold higher than placebo)
  - Nausea
  - Sleep disturbances (insomnia, abnormal dreams)
  - Constipation
  - Flatulence
  - Vomiting

VARENICLINE: ADDITIONAL PATIENT EDUCATION

- Doses should be taken after eating, with a full glass of water
- Nausea and insomnia are usually temporary side effects
  - If symptoms persist, notify your health care provider
- May experience vivid, unusual or strange dreams during treatment
- Use caution driving or operating machinery until effects of quitting smoking with varenicline are known

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
VARENICLINE:
ADDITIONAL PATIENT EDUCATION (cont’d)

- Stop taking varenicline and contact a health-care provider immediately if agitation, depressed mood, suicidal thoughts or changes in behavior are noted.
- Stop taking varenicline at the first sign of rash with mucosal lesions and contact a health-care provider immediately.
- Discontinue varenicline and seek immediate medical care if swelling of the face, mouth (lip, gum, tongue) and neck are noted.

VARENICLINE: SUMMARY

ADVANTAGES
- Easy to use oral formulation.
- Twice daily dosing might reduce compliance problems.
- Offers a new mechanism of action for persons who have failed other agents.

DI SADVANTAGES
- May induce nausea in up to one third of patients.
- Post-marketing surveillance data indicate potential for neuropsychiatric symptoms.

LONG-TERM (≥6 month) QUIT RATES for AVAILABLE CESSATION MEDICATIONS

COMBINATION PHARMACOTHERAPY

Regimens with enough evidence to be ‘recommended’ first-line
- Combination NRT
  Long-acting formulation (patch)
  Produces relatively constant levels of nicotine
  PLUS
  Short-acting formulation (gum, inhaler, nasal spray)
  Allows for acute dose titration as needed for nicotine withdrawal symptoms
  - Bupropion SR + Nicotine Patch

COMPLIANCE IS KEY to QUITTING

- Promote compliance with prescribed regimens.
- Use according to dosing schedule, NOT as needed.
- Consider telling the patient:
  - “When you use a cessation product it is important to read all the directions thoroughly before using the product. The products work best in alleviating withdrawal symptoms when used correctly, and according to the recommended dosing schedule.”

COMPARATIVE DAILY COSTS of PHARMACOTHERAPY

Copyright © 1999-2011 The Regents of the University of California. All rights reserved. Updated March 2011.
The RESPONSIBILITY of HEALTH PROFESSIONALS

It is inconsistent to provide health care and—at the same time—remain silent (or inactive) about a major health risk.

TOBACCO CESSATION is an important component of THERAPY.

BRIEF COUNSELING: ASK, ADVISE, REFER (cont’d)

- Brief interventions have been shown to be effective
- In the absence of time or expertise:
  - Ask, advise, and refer to other resources, such as local group programs or the toll-free quitline 1-800-QUIT-NOW

DR. GRO HARLEM BRUNTLAND, FORMER DIRECTOR-GENERAL of the WHO:

“If we do not act decisively, a hundred years from now our grandchildren and their children will look back and seriously question how people claiming to be committed to public health and social justice allowed the tobacco epidemic to unfold unchecked.”

STEP One: ASK about Tobacco Use

- Suggested Dialogue
  - Do you ever smoke or use any type of tobacco?
  - Condition X often is caused or worsened by exposure to tobacco smoke. Do you, or does someone in your household smoke?
  - Medication X often is used for conditions linked with or caused by smoking. Do you, or does someone in your household smoke?

STEP Two: ADVISE to Quit

- Suggested Dialogue
  - Quitting is the most important thing you can do to protect your health now and in the future. I have training to help my patients quit, and when you are ready I would be more than happy to work with you to design a treatment plan.
  - What are your thoughts about quitting? Might you consider quitting sometime in the next month?
  - Prior to imparting advice, consider asking the patient for permission to do so – e.g., “May I tell you why this concerns me?” [then elaborate on patient-specific concerns]

STEP Three: ASSESS Readiness to Quit

- Does the patient now use tobacco?
  - YES
  - NO
- Is the patient now ready to quit?
  - NO
  - YES
- Did the patient once use tobacco?
  - YES
  - NO

Foster motivation
Provide treatment
Prevent relapse*
Encourage continued abstinence

The 5 R’s
The 5 A’s or referral

* Relapse prevention interventions are not necessary if patient has not used tobacco for many years and is not at risk for re-initiation.

STEP Four: ASSIST with Quitting

- Suggested Dialogue
  - Current use: type(s) of tobacco used, amount
  - Past use:
    - Duration of tobacco use
    - Changes in levels of use recently
  - Past quit attempts:
    - Number of attempts, date of most recent attempt, duration
    - Methods used previously—What did or didn’t work? Why or why not?
    - Prior medication administration, dose, compliance, duration of treatment
    - Reasons for relapse
  - Medication X often is used for conditions linked with or caused by smoking. Do you, or does someone in your household smoke?
  - Meditation X often is used for conditions linked with or caused by smoking. Do you, or does someone in your household smoke?

Discuss Key Issues (for the upcoming or current quit attempt)
- Reasons/motivation for wanting to quit (or avoid relapse)
- Confidence in ability to quit (or avoid relapse)
- Triggers for tobacco use
- Routines and situations associated with tobacco use
- Stress-related tobacco use
- Concerns about weight gain
- Concerns about withdrawal symptoms

Facilitate Quitting Process
- Discuss methods for quitting: pros and cons of the different methods
- Set a quit date: ideally, less than 2 weeks away
- Recommend Tobacco Use Log
- Discuss coping strategies (cognitive, behavioral)
- Discuss withdrawal symptoms
- Discuss concept of “slip” versus relapse
- Provide medication counseling: compliance, proper use, with demonstration
- Offer to assist throughout the quit attempt

Evaluate the Quit Attempt (at follow-up)
- Status of attempt
- “Slips” and relapse
- Medication compliance and plans for discontinuation

STEP Five: ARRANGE Follow-up Counseling

- Monitor patients’ progress throughout the quit attempt. Follow-up contact should occur during the first week after quitting. A second follow-up contact is recommended in the first month. Additional contacts should be scheduled as needed. Counseling contacts can occur face-to-face, by telephone, or by e-mail. Keep patient progress notes.
- Address temptations and triggers; discuss strategies to prevent relapse.
- Congratulate patients for continued success.

Copyright © 1999-2011 The Regents of the University of California. All rights reserved.

WITHDRAWAL SYMPTOMS INFORMATION SHEET

Quitting tobacco use brings about a variety of physical and psychological withdrawal symptoms. For some people, coping with withdrawal symptoms is like riding a roller coaster—there may be sharp turns, slow climbs, and unexpected plunges. Most symptoms manifest within the first 1 to 2 days, peak within the first week, and subside within 2 to 4 weeks. Report new symptoms to your health-care provider, especially if severe. Consider the impact of recent medication changes and your caffeine intake.

# MODIFIED FAGERSTRÖM TOLERANCE QUESTIONNAIRE (ADOLESCENTS)

1. **How many cigarettes a day do you smoke?**
   - Over 26 cigarettes a day ................................................................. 2
   - About 16–25 cigarettes a day .............................................................. 1
   - About 1–15 cigarettes a day ............................................................... 0
   - Less than 1 a day ............................................................................ 0

2. **Do you inhale?**
   - Always ............................................................................................ 2
   - Quite often ...................................................................................... 1
   - Seldom ............................................................................................ 1
   - Never .............................................................................................. 0

3. **How soon after you wake up do you smoke your first cigarette?**
   - Within the first 30 minutes ............................................................ 1
   - More than 30 minutes after waking but before noon ...................... 0
   - In the afternoon .............................................................................. 0
   - In the evening ................................................................................ 0

4. **Which cigarette would you hate to give up?**
   - First cigarette in the morning ......................................................... 1
   - Any other cigarette before noon ....................................................... 0
   - Any other cigarette afternoon .......................................................... 0
   - Any other cigarette in the evening ................................................... 0

5. **Do you find it difficult to refrain from smoking in places where it is forbidden (e.g., church, library, movies)?**
   - Yes, very difficult .......................................................................... 1
   - Yes, somewhat difficult ................................................................. 1
   - No, not usually difficult ................................................................. 0
   - No, not at all difficult ..................................................................... 0

6. **Do you smoke if you are so ill that you are in bed most of the day?**
   - Yes, always .................................................................................. 1
   - Yes, quite often .............................................................................. 1
   - No, not usually .............................................................................. 0
   - No, never ........................................................................................ 0

7. **Do you smoke more during the first 2 hours than during the rest of the day?**
   - Yes ................................................................................................ 1
   - No ................................................................................................. 0

**Total Score:**

---

### SMOKELESS TOBACCO DEPENDENCE SCALE

1. How many tins or pouches of smokeless tobacco do you typically use each week?  
   - 1 or less each week ................................................................. 0  
   - 2–4 each week ............................................................................ 1  
   - 5 or more each week ................................................................. 2  

2. How often do you use smokeless tobacco?  
   - 1 day each week or less ............................................................. 0  
   - 2–5 days each week .................................................................. 1  
   - 6–7 days each week ................................................................. 2  

3. Do you intentionally swallow tobacco juices?  
   - No ........................................................................................... 0  
   - Yes .......................................................................................... 1  

4. Do you use smokeless tobacco when you are sick or have mouth sores?  
   - No ........................................................................................... 0  
   - Yes .......................................................................................... 1  

5. How soon after waking from your normal sleeping period do you use chewing tobacco or snuff?  
   - After 30 minutes of waking ..................................................... 0  
   - Within 30 minutes of waking ................................................. 1  

6. Do you smoke cigarettes?  
   - No ........................................................................................... 0  
   - Yes .......................................................................................... 1  

7. Is it difficult for you not to use smokeless tobacco where its use is restricted or not allowed?  
   - No ........................................................................................... 0  
   - Yes .......................................................................................... 1  

---

**Total Score:** 

Many interactions between tobacco smoke and medications have been identified. Note that in most cases it is the tobacco smoke—not the nicotine—that causes these drug interactions. Tobacco smoke interacts with medications through pharmacokinetic (PK) and pharmacodynamic (PD) mechanisms. PK interactions affect the absorption, distribution, metabolism, or elimination of other drugs, potentially causing an altered pharmacologic response. The majority of PK interactions with smoking are the result of induction of hepatic cytochrome P450 enzymes (primarily CYP1A2). PD interactions alter the expected response or actions of other drugs. The potentially causing an altered pharmacologic response. The majority of PK interactions with smoking are the result of induction of hepatic cytochrome P450 enzymes (primarily CYP1A2). PD interactions alter the expected response or actions of other drugs.

<table>
<thead>
<tr>
<th>DRUG/CLASS</th>
<th>MECHANISM OF INTERACTION AND EFFECTS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pharmacokinetic Interactions</strong></td>
<td></td>
</tr>
<tr>
<td>Alprazolam (Xanax)</td>
<td>• Conflicting data on significance, but possible ↓ plasma concentrations (up to 50%); ↓ half-life (35%).</td>
</tr>
<tr>
<td>Bendamustine (Treanda)</td>
<td>• Metabolized by CYP1A2. Manufacturer recommends using with caution in smokers due to likely ↓ bendamustine concentrations, with ↑ concentrations of its two active metabolites.</td>
</tr>
<tr>
<td>Caffeine</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↑ clearance (56%). Caffeine levels likely ↑ after cessation.</td>
</tr>
<tr>
<td>Chlorpromazine (Thorazine)</td>
<td>• ↓ Area under the curve (AUC) (36%) and serum concentrations (24%). • ↑ Sedation and hypotension possible in smokers; smokers may require ↑ dosages.</td>
</tr>
<tr>
<td>Clopidogrel (Plavix)</td>
<td>• ↑ Metabolism (induction of CYP1A2) of clopidogrel to its active metabolite. • Clopidogrel’s effects are enhanced in smokers (≥10 cigarettes/day); significant ↑ platelet inhibition, ↓ platelet aggregation; while improved clinical outcomes have been shown, may also ↑ risk of bleeding.</td>
</tr>
<tr>
<td>Clozapine (Clozaril)</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↓ plasma concentrations (18%). • ↑ Levels upon cessation may occur; closely monitor drug levels and reduce dose as required to avoid toxicity.</td>
</tr>
<tr>
<td>Erlotinib (Tarceva)</td>
<td>• ↑ Clearance (24%); ↓ trough serum concentrations (2-fold).</td>
</tr>
<tr>
<td>Flecainide (Tambocor)</td>
<td>• ↑ Clearance (61%); ↓ trough serum concentrations (25%). Smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Fluvoxamine (Luvox)</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↑ clearance (24%); ↓ AUC (31%); ↓ plasma concentrations (32%).</td>
</tr>
<tr>
<td>Haloperidol (Haldol)</td>
<td>• ↑ Clearance (44%); ↓ serum concentrations (70%).</td>
</tr>
<tr>
<td>Heparin</td>
<td>• Mechanism unknown but ↑ clearance and ↓ half-life are observed. Smoking has prothrombotic effects. • Smokers may need ↑ dosages due to PK and PD interactions.</td>
</tr>
<tr>
<td>Insulin, subcutaneous</td>
<td>• Possible ↓ insulin absorption secondary to peripheral vasoconstriction; smoking may cause release of endogenous substances that cause insulin resistance. • PK &amp; PD interactions likely not clinically significant; smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Irinotecan (Camptosar)</td>
<td>• ↑ Clearance (18%); ↓ serum concentrations of active metabolite, SN-38 (~40%; via induction of glucuronidation); ↓ systemic exposure resulting in lower hematologic toxicity and may reduce efficacy. • Smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Mexiletine (Mexitil)</td>
<td>• ↑ Clearance (25%; via oxidation and glucuronidation); ↓ half-life (36%).</td>
</tr>
<tr>
<td>Olanzapine (Zyprexa)</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↑ clearance (98%); ↓ serum concentrations (12%). • Dosage modifications not routinely recommended but smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Propranolol (Inderal)</td>
<td>• ↑ Clearance (77%; via side-chain oxidation and glucuronidation).</td>
</tr>
<tr>
<td>Ropinirole (Requip)</td>
<td>• ↓ Cmax (30%) and AUC (38%) in study with patients with restless legs syndrome. • Smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Tacrine (Cognex)</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↓ half-life (50%); serum concentrations 3-fold lower. • Smokers may need ↑ dosages.</td>
</tr>
<tr>
<td>Theophylline (Theo Dur, etc.)</td>
<td>• ↑ Metabolism (induction of CYP1A2); ↑ clearance (58–100%); ↓ half-life (63%). • Levels should be monitored if smoking is initiated, discontinued, or changed. Maintenance doses are considerably higher in smokers. • ↑ Clearance with second-hand smoke exposure.</td>
</tr>
<tr>
<td>Tricyclic antidepressants (e.g., imipramine, nortriptyline)</td>
<td>• Possible interaction with tricyclic antidepressants in the direction of ↓ blood levels, but the clinical significance is not established.</td>
</tr>
<tr>
<td>Tizanidine (Zanaflex)</td>
<td>• ↓ AUC (30–40%) and ↓ half-life (10%) observed in male smokers.</td>
</tr>
<tr>
<td>Warfarin</td>
<td>• ↑ Metabolism (induction of CYP1A2) of R-enantiomer; however, S-enantiomer is more potent and effect on INR is inconclusive. Consider monitoring INR upon smoking cessation.</td>
</tr>
</tbody>
</table>

**Pharmacodynamic Interactions**

| Benznidazepines (diazepam, chlordiazepoxide) | • ↓ Sedation and drowsiness, possibly caused by nicotine stimulation of central nervous system. |
| Beta-blockers | • Less effective antihypertensive and heart rate control effects; possibly caused by nicotine-mediated sympathetic activation. • Smokers may need ↑ dosages. |
| Corticosteroids, inhaled | • ↑ Risk of cardiovascular adverse effects (e.g., stroke, myocardial infarction, thromboembolism) in women who smoke and use oral contraceptives. Ortho Evra patch users shown to have 2-fold ↑ risk of venous thromboembolism compared to oral contraceptive users, likely due to ↑ estrogen exposure (60% higher levels). • ↑ Risk with age and with heavy smoking (≥15 cigarettes per day) and is quite marked in women ≥35 years old. |
| Hormonal contraceptives | • ↑ Analgesic effect; smoking may ↑ the metabolism of propoxyphene (15–20%) and pentazocine (40%). Mechanism unknown. • Smokers may need ↑ opioid dosages for pain relief. |

TOBACCO USE LOG

The Tobacco Use Log can help patients to identify activities or situations that trigger the desire to smoke or use other forms of tobacco. It is important for patients to understand these environmental cues so that they can develop coping strategies to overcome the temptation to use tobacco. Clinicians can use this information to suggest alternative behaviors to increase the likelihood of a successful quit attempt. The log is most appropriate for patients who are preparing for a quit attempt, but it can be used with any patient who wants to learn more about his or her smoking behavior.

Instructions for use:
The Tobacco Use Log is a piece of paper that is kept with the patient's tobacco. It can be folded and wrapped around the cigarette pack or can of snuff with a rubber band. Alternatively, patients may keep the log in their wallet or day planner. It is important that the log be readily available at the times when the patient uses the tobacco. Through careful documentation of tobacco use over a period of several days, patient-specific tobacco usage patterns become evident.

1. Instruct the patient to continue his or her regular tobacco use for a period of at least three days (including one non–work day). It is preferable to complete the Tobacco Use Log for seven consecutive days, because usage patterns might fluctuate as a function of the day of the week (e.g. weekends vs. work days). The patient should not attempt to reduce his or her tobacco use during this time. The intent is to document current tobacco use habits and patterns, so that the patient can understand the triggers and situations associated with his or her tobacco use.

2. The following information should be noted in the Tobacco Use Log each time tobacco is used:
   - **Time** of day (indicate AM or PM)
   - Description of the **activity**/situation at the **time** of tobacco use (e.g., were others present?)
   - **Need rating** of the patient's perceived importance of using tobacco, at that time, using the following scale:
     - Not very important (would not have missed it) 1
     - Moderately important 2
     - Very important (would have missed it a great deal) 3

3. The patient should use a separate log sheet each day. **Note:** Heavy tobacco users will require more than one log sheet per day.

4. Just prior to the quit date, review the Tobacco Use Log with the patient to identify specific situations that trigger tobacco use. Additionally, develop specific cognitive and behavioral strategies to prevent relapse.

# Coping with Quitting: Cognitive and Behavioral Strategies

## Cognitive Strategies

Focus on *retraining the way a patient thinks*. Often, patients mentally deliberate on the fact that they are thinking about a cigarette, and this leads to relapse. Patients must recognize that thinking about a cigarette doesn’t mean they need to have one.

### Review Commitment to Quit

Each morning, say, “I am proud that I made it through another day without tobacco!” Remind oneself that cravings and temptations are temporary and will pass. Announce, either silently or aloud, “I am a nonsmoker, and the temptation will pass.”

### Distractive Thinking

Use deliberate, immediate refocusing of thinking toward other thoughts when cued by thoughts about tobacco use.

### Positive Self-Talks, Pep Talks

Say, “I can do this,” and remind oneself of previous difficult situations in which tobacco use was avoided.

### Relaxation Through Imagery

Center mind toward positive, relaxing thoughts.

### Mental Rehearsal, Visualization

Prepare for situations that might arise by envisioning how best to handle them. For example, envision what would happen if offered a cigarette by a friend—mentally craft and rehearse a response, and perhaps even practice it by saying it aloud.

## Behavioral Strategies

Involve specific actions to reduce risk for relapse. These strategies should be considered prior to quitting, after determining patient-specific triggers and routines or situations associated with tobacco use. Below are strategies for several of the more common cues or causes for relapse.

### Stress

Anticipate upcoming challenges at work, at school, or in personal life. Develop a substitute plan for tobacco use during times of stress (e.g., use deep breathing, take a break or leave the situation, call a supportive friend or family member, perform self-massage, use nicotine replacement therapy).

### Alcohol

Drinking alcohol can lead to relapse. Consider limiting or abstaining from alcohol during the early stages of quitting.

### Other Tobacco Users

Quitting is more difficult if the patient is around other tobacco users. This is especially difficult if another tobacco user is in the household. During the early stages of quitting, limit prolonged contact with individuals who are using tobacco. Ask co-workers, friends, and housemates not to smoke or use tobacco in your presence.

### Oral Gratification Needs

Have nontobacco oral substitutes (e.g., gum, sugarless candy, straws, toothpicks, lip balm, toothbrush, nicotine replacement therapy, bottled water) readily available.

### Automatic Smoking Routines

Anticipate routines associated with tobacco use and develop an alternative plan. Examples:
- **Morning Coffee**: change morning routine, drink tea instead of coffee, take shower before drinking coffee, take a brisk walk shortly after awakening.
- **While Driving**: remove all tobacco from car, have car interior detailed, listen to a book on tape or talk radio, use oral substitute.
- **While on the Phone**: stand while talking, limit call duration, change phone location, keep hands occupied by doodling or sketching.
- **After Meals**: get up and immediately do dishes or take a brisk walk after eating, call supportive friend.

### Postcessation Weight Gain

Do not attempt to modify multiple behaviors at one time. If weight gain is a barrier to quitting, engage in regular physical activity and adhere to a healthful diet (as opposed to strict dieting). Carefully plan and prepare meals, increase fruit and water intake to create a feeling of fullness, and chew sugarless gum or eat sugarless candies. Consider use of pharmacotherapy shown to delay weight gain (e.g., nicotine gum, nicotine lozenge, bupropion).

### Cravings for Tobacco

Cravings for tobacco are temporary and usually pass within 5–10 minutes. Handle cravings through distractive thinking, take a break, do something else, take deep breaths, perform self-massage.
Understanding the reasons why you smoke, in addition to considering your smoking patterns and routines, are important to the design of a successful quitting plan. Consider the following before you quit:

**WHY DO I STILL SMOKE?**

<table>
<thead>
<tr>
<th>My top 3 reasons for continuing to smoke are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
</tr>
<tr>
<td>(2)</td>
</tr>
<tr>
<td>(3)</td>
</tr>
</tbody>
</table>

**WHY IS QUITTING IMPORTANT?**

<table>
<thead>
<tr>
<th>My top 3 reasons for wanting to quit smoking are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
</tr>
<tr>
<td>(2)</td>
</tr>
<tr>
<td>(3)</td>
</tr>
</tbody>
</table>

**WHAT WERE YOUR MAIN DIFFICULTIES WITH QUITTING IN THE PAST?**

<table>
<thead>
<tr>
<th>My top 3 difficulties with quitting in the past were:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
</tr>
<tr>
<td>(2)</td>
</tr>
<tr>
<td>(3)</td>
</tr>
</tbody>
</table>

**WHAT ARE YOUR BARRIERS TO QUITTING NOW?**

<table>
<thead>
<tr>
<th>My top 3 barriers to quitting now are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
</tr>
<tr>
<td>(2)</td>
</tr>
<tr>
<td>(3)</td>
</tr>
</tbody>
</table>

**WHAT IS THE WORST THING THAT COULD HAPPEN TO YOU IF YOU QUIT SMOKING FOR GOOD?**

- **ARE YOU READY TO QUIT NOW? (WITHIN THE NEXT MONTH)**

  If YES, what will be your official quit date? ___ / ___ / ___ (ENTER DATE)

  If NO, how will it benefit you to quit later?
Smokers don’t plan to fail. Most fail to plan. To plan for quitting you should: (1) identify triggers for smoking and how to cope with them, (2) identify persons to help you throughout your quit attempt, and (3) choose the best methods—for you—for quitting.

### What are your three main triggers or situations for smoking?

To deal with situations when you feel the urge to smoke, you should (1) identify the trigger situation, (2) change what you do or how you do it, and (3) change the thoughts that trigger the desire to smoke.

| Trigger #1: |  
|-------------|---|
| I will change **what I do** in this situation by: |  
| I will change **how I think** in this situation by: |  

| Trigger #2: |  
|-------------|---|
| I will change **what I do** in this situation by: |  
| I will change **how I think** in this situation by: |  

| Trigger #3: |  
|-------------|---|
| I will change **what I do** in this situation by: |  
| I will change **how I think** in this situation by: |  

### Who will help you with quitting?

My top 3 persons who will have a positive influence on my ability to quit for good:

1.  
2.  
3.  

### What form of counseling assistance will you receive while quitting?

### What medication(s) will you use for quitting, and how will you use them?
# Pharmacologic Product Guide: FDA-Approved Medications for Smoking Cessation

## Nicotine Replacement Therapy (NRT) Formulations

<table>

<td>Chantix² Rx 0.5 mg, 1 mg tablet</td>
</tr>
</tbody>
</table>

### Gum
- **Nicorette Lozenge**
  - 1 mg: cherry, mint
  - 2 mg, 4 mg: original, cinnamon, fruit, mint, orange
- **Nicorette Mini Lozenge**
  - 1 mg: cherry, mint
  - 2 mg: original, cinnamon, fruit, mint, orange

### Lozenge
- **Nicorette Lozenge**
  - 1 mg: cherry, mint
  - 2 mg: original, cinnamon, fruit, mint, orange
  - 4 mg: original, cinnamon, fruit, mint, orange

### Transdermal Patch
- **Nicoderm CQ**
  - 7 mg: (24-hour release)
  - 14 mg: (24-hour release)
  - 21 mg: (24-hour release)

### Nasal Spray
- **Nicotrol NS**
  - 0.5 mg nicotine in 50 mL aqueous nicotine solution

### Oral Inhaler
- **Nicotrol Inhaler**
  - 1 mg cartridge delivers 4 mg inhaled nicotine vapor

### Bupropion SR
- **Zyban**
  - 100 mg sustained-release tablet

### Varenicline
- **Chantix**
  - 0.5 mg, 1 mg tablet

## Precautions

- **Contraindications**:
  - Seizure disorder
  - Concomitant bupropion or MAO inhibitor therapy in patients with bulimia or anorexia nervosa
  - Severe hepatic cirrhosis
  - Pregnancy (category C) and breastfeeding
  - Adolescents (<18 years)

## Dosing

### Nicorette Lozenge
- **>25 cigarettes/day**: 4 mg
  - 1 piece q 1–2 hours
  - Weeks 1–6: 1 piece q 1–2 hours
  - Weeks 7–12: 1 piece q 1–2 hours
  - Maximum, 24 pieces/day
- **<25 cigarettes/day**: 2 mg
  - 1 piece q 1–2 hours
  - Weeks 1–6: 1 piece q 1–2 hours
  - Weeks 7–12: 1 piece q 2–4 hours
  - Maximum, 20 lozenges/day

### Nicorette Mini Lozenge
- **>25 cigarettes/day**: 2 mg
  - 1 piece q 2–4 hours
  - Weeks 1–6: 1 piece q 2–4 hours
  - Weeks 7–12: 1 piece q 2–4 hours
  - Maximum, 24 pieces/day

### Nicoderm CQ
- **>25 cigarettes/day**: 7 mg/day x 2 weeks
  - 1 piece q 4–8 hours
  - Maximum, 20 lozenges/day

### Nicotrol NS
- **>10 cigarettes/day**: 7 mg/day x 2 weeks
  - 1 piece q 4–8 hours
  - Maximum, 20 lozenges/day

### Nicotrol Inhaler
- **>10 cigarettes/day**: 14 mg/day x 2 weeks
  - 1 piece q 1 hour
  - Maximum, 20 pieces/day

### Nicotrol Inhaler
- **<10 cigarettes/day**: 7 mg/day x 2 weeks
  - 1 piece q 1–2 hours
  - Maximum, 20 pieces/day

### Zyban
- **100 mg q AM x 3 days, then 150 mg po bid**

## Duration

- **Nicorette Lozenge**
  - Duration: up to 12 weeks
  - Duration: up to 12 weeks
  - Duration: up to 12 weeks

- **Nicorette Mini Lozenge**
  - Duration: up to 12 weeks
  - Duration: up to 12 weeks
  - Duration: up to 12 weeks

- **Nicoderm CQ**
  - Duration: 7–12 weeks
  - Duration: 3–6 months

- **Nicotrol NS**
  - Duration: 3–6 months
  - Duration: up to 12 weeks
  - Duration: 3–6 months

- **Nicotrol Inhaler**
  - Duration: 1–2 hours
  - Duration: 3–6 months

- **Zyban**
  - Duration: 3–6 months
  - Duration: 7–12 weeks
  - Duration: 10 weeks

## Parental Monitoring
- **Nicorette Lozenge**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 1–2 weeks

- **Nicorette Mini Lozenge**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 1–2 weeks

- **Nicoderm CQ**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 7–12 weeks

- **Nicotrol NS**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 3–6 months

- **Nicotrol Inhaler**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 1–2 weeks

- **Zyban**
  - Ensure patient experiences sleep disturbances, dizziness, or tinnitus
  - Duration: 3–6 months

## Additional Information

- **Nicorette Lozenge**
  - Peppery or tingling sensation appears after chewing
  - Repeat chew/park steps until most of the nicotine is gone
  - Duration: up to 12 weeks

- **Nicorette Mini Lozenge**
  - Peppery or tingling sensation appears after chewing
  - Repeat chew/park steps until most of the nicotine is gone
  - Duration: up to 12 weeks

- **Nicoderm CQ**
  - Peppery or tingling sensation appears after applying the patch
  - Duration: up to 12 weeks

- **Nicotrol NS**
  - Peppery or tingling sensation appears after applying the patch
  - Duration: up to 12 weeks

- **Nicotrol Inhaler**
  - Peppery or tingling sensation appears after applying the patch
  - Duration: up to 12 weeks

- **Zyban**
  - Peppery or tingling sensation appears after applying the patch
  - Duration: up to 12 weeks

| Cost [1][4] | 2 mg or 4 mg: $2.25–$4.41 (9 pieces) | 2 mg or 4 mg: $2.61–$4.95 (9 pieces) | $1.87–$3.52 (1 patch) | $4.43 (8 doses) | $7.68 (6 cartridges) | $3.62–$7.46 (2 tablets) | $5.38–$6.20 (2 tablets) |

1. Marketed by GlaxoSmithKline.
2. Marketed by Pfizer.
3. The U.S. Clinical Practice Guideline states that pregnant smokers should be encouraged to quit without medication based on insufficient evidence of effectiveness and theoretical concerns with safety. Pregnant smokers should be offered behavioral counseling interventions that exceed minimal advice to quit.
4. In July 2009, the FDA mandated that the prescribing information for all bupropion- and varenicline-containing products include a black-boxed warning highlighting the risk of serious neuropsychiatric symptoms, including changes in behavior, hostility, agitation, depressed mood, suicidal thoughts and behavior, and attempted suicide. Clinicians should advise patients to stop taking varenicline or bupropion SR and contact a healthcare provider immediately if they experience agitation, depressed mood, and any changes in behavior that are not typical of nicotine withdrawal, or if they experience suicidal thoughts or behavior. If treatment is stopped due to neuropsychiatric symptoms, patients should be monitored until the symptoms resolve.

Abbreviations: MAO, monoamine oxidase; NRT, nicotine replacement therapy; OTC, over-the-counter (non-prescription product); Rx, prescription product.

For complete prescribing information, please refer to the manufacturers’ package inserts.

Many smokers who relapse do so because they fail to plan. Often, patients think that they can simply "make" themselves quit and do not avail themselves of the many proven behavior change programs provided by various sources. Furthermore, most smokers do not use a cessation medication or, if they do, they use it incorrectly. Generally speaking, patients significantly under-dose or stop pharmacologic therapy too soon.

You can help relapsed smokers regain abstinence by encouraging them to learn from their prior experiences rather than use those experiences as proof that they cannot quit. To underscore this perspective, inform patients that the best way to quit smoking is to combine a behavior change program with a cessation medication. The following 3-step protocol will help you provide this information in an efficient, effective manner for patients who are ready to try again:

**STEP 1: ASK**

- "TELL ME ABOUT YOUR LAST QUIT ATTEMPT(S)."
- "DID YOU USE A SMOKING CESSATION MEDICATION?"
  - If yes: "EXPLAIN HOW YOU USED YOUR MEDICATION."
    - Reinforce proper usage/rectify incorrect usage or dosage
  - If no: "WHAT WAS YOUR REASONING FOR NOT USING A MEDICATION?"
- "DID YOU RECEIVE ANY PROFESSIONAL ADVICE OR ENROLL IN A BEHAVIOR CHANGE PROGRAM?"
  - If yes: "TELL ME WHAT YOU LIKED, OR DIDN’T LIKE ABOUT THE ASSISTANCE YOU RECEIVED."
  - If no: "WHAT WAS YOUR REASONING FOR NOT SEEKING ADVICE OR ENROLLING IN A PROGRAM?"

**STEP 2: ADVISE**

- "ACCORDING TO THE MOST CURRENT RESEARCH AND THE SURGEON GENERAL, THE BEST WAY TO QUIT IS TO COMBINE A SMOKING CESSATION MEDICATION WITH A BEHAVIORAL PROGRAM."
  **NOTE:** Examples of behavior change programs are listed on the reverse side, under the “Refer” section of the protocol.
- "LET’S DISCUSS WHICH MEDICATION(S) WOULD BE BEST FOR YOU."
- Review current level of tobacco use, past usage of medications, personal preference, precautions/contraindications, etc. to determine best product for current quit attempt.
  **NOTE:** Refer to the Rx for Change *Pharmacologic Product Guide* for dosing instructions, etc. for FDA-approved smoking cessation medications.
- Consider the following options:
  - If prior medication was used correctly, was well tolerated, and appeared to have been effective, consider repeating the same medication regimen in conjunction with an enhanced behavioral program.
  - If prior medication was used incorrectly, carefully review usage instructions.
  - If prior medication was used correctly but did not control urges/withdrawal, or if patient prefers something new, review other medication options, including both single and combination therapy:
Combination therapy currently is off-label for all cessation medications, but is supported by multiple clinical trials and the Clinical Practice Guideline for Treating Tobacco Use and Dependence (p. 118):

- **Safe**: Most smokers are highly tolerant to nicotine from years of smoking. Side effects are rare and easily mitigated by reducing or stopping use.
- **Effective**: Especially in those who failed with one medication. Also useful in patients who are heavily dependent (2 or more packs/day).

Suggested combinations:

- Nicotine patch + *ad libitum* gum, lozenge, inhaler, or nasal spray as needed for breakthrough urges.
- Sustained-release bupropion (Zyban) + nicotine patch

Currently, varenicline (Chantix) is not recommended for combination therapy

**STEP 3: REFER**

The amount of counseling that patients receive is linearly related to their success in quitting. More counseling contacts yield higher quit rates. If you do not have the time or expertise to assist patients with quitting and to provide follow-up counseling, refer patients to other resources:

- **To a behavior change program:**
  
  > "HERE ARE SOME SUGGESTIONS. WHICH DO YOU THINK WOULD WORK BEST FOR YOU?"
  
  - 1 800 QUIT NOW, the national toll-free telephone quit line
  - All products are accompanied by a free behavior change program: Refer to usage instructions for enrollment procedures
  - Hospital-based or other local resources (e.g., a group program)
  - www.quitnet.com, an on-line tobacco cessation support program
  - smokefree.gov, an on-line guide for quitting
  - American Lung Association, American Cancer Society, or American Heart Association web-sites or cessation programs (e.g., American Lung Association’s Freedom From Smoking group cessation program)
  - Local pharmacist, physician, or other health-care provider specializing in cessation

- **To a community pharmacist:**
  
  > "WHEN YOU PURCHASE YOUR SMOKING CESSATION MEDICATION, PLEASE TAKE A FEW MINUTES TO DISCUSS PROPER USAGE WITH THE PHARMACIST, EVEN IF IT IS A PRODUCT YOU HAVE USED IN THE PAST. PROPER USAGE WILL GIVE YOU THE BEST CHANCE OF SUCCESS."

- **To other staff:**
  
  - If you have dedicated cessation staff within your clinic or health-care organization, refer patient to these resources for follow-up counseling.

<sup>a</sup> Estimated relative to referent group

<sup>b</sup> Abstinence percentages for specified treatment method

<sup>c</sup> A quitline that responds to incoming calls and makes outbound followup calls. Following an initial request by the smoker or via a fax-to-quit program, the clinician initiates telephone contact to counsel the patient.

<sup>d</sup> One qualifying randomized trial; 95% CI not reported in 2008 Clinical Practice Guideline

<sup>e</sup> Not approved by the U.S. Food and Drug Administration as a smoking cessation aid; recommended by the USPHS Guideline as a second-line agent for treating tobacco use and dependence.

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Recommendation Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tobacco dependence is a chronic disease that often requires repeated intervention and multiple attempts to quit. Effective treatments exist, however, that can significantly increase rates of long-term abstinence.</td>
</tr>
<tr>
<td>2</td>
<td>It is essential that clinicians and health care delivery systems consistently identify and document tobacco use status and treat every tobacco user seen in a health care setting.</td>
</tr>
<tr>
<td>3</td>
<td>Tobacco dependence treatments are effective across a broad range of populations. Clinicians should encourage every patient willing to make a quit attempt to use the counseling treatments and medications recommended in this Guideline.</td>
</tr>
<tr>
<td>4</td>
<td>Brief tobacco dependence treatment is effective. Clinicians should offer every patient who uses tobacco at least the brief treatments shown to be effective in this Guideline.</td>
</tr>
<tr>
<td>5</td>
<td>Individual, group, and telephone counseling are effective, and their effectiveness increases with treatment intensity. Two components of counseling are especially effective, and clinicians should use these when counseling patients making a quit attempt: (a) practical counseling (problem solving/skills training) and (b) social support delivered as part of treatment.</td>
</tr>
<tr>
<td>6</td>
<td>Numerous effective medications are available for tobacco dependence, and clinicians should encourage their use by all patients attempting to quit smoking—except where medically contraindicated or with specific populations for which there is insufficient evidence of effectiveness (i.e., pregnant women, smokeless tobacco users, light smokers, and adolescents). Seven first-line medications (5 nicotine and 2 non-nicotine) reliably increase long-term smoking abstinence rates: bupropion SR, nicotine gum, nicotine inhaler, nicotine lozenge, nicotine nasal spray, nicotine patch, and varenicline. Clinicians also should consider the use of certain combinations of medications identified as effective in this Guideline.</td>
</tr>
<tr>
<td>7</td>
<td>Counseling and medication are effective when used by themselves for treating tobacco dependence. The combination of counseling and medication, however, is more effective than either alone. Thus, clinicians should encourage all individuals making a quit attempt to use both counseling and medication.</td>
</tr>
<tr>
<td>8</td>
<td>Telephone quitline counseling is effective with diverse populations and has broad reach. Therefore, both clinicians and health care delivery systems should ensure patient access to quitlines and promote quitline use.</td>
</tr>
<tr>
<td>9</td>
<td>If a tobacco user currently is unwilling to make a quit attempt, clinicians should use the motivational treatments shown in this Guideline to be effective in increasing future quit attempts.</td>
</tr>
<tr>
<td>10</td>
<td>Tobacco dependence treatments are both clinically effective and highly cost-effective relative to interventions for other clinical disorders. Providing coverage for these treatments increases quit rates. Insurers and purchasers should ensure that all insurance plans include the counseling and medication identified as effective in this Guideline as covered benefits.</td>
</tr>
